

In depth Analysis: HR Analytics Dashboard (PowerBI)

1. Overall workforce overview

- The organization has total workforce of 1416 employees, out of which 299 employees have left, resulting in an attrition rate of 16.2%
From a HR perspective:
- An attrition rate above 15% is generally considered moderate to high, especially for knowledge based or skilled roles.
- This indicates retention challenge that require targeted interventions rather than organization wide generic policies.

Additional workforce context:

- Average age : 37 years mid career workflow
- Average salary: 6.5k concentrated around lower to mid salary band
- Average tenure: 7 years are not leaving immediately; attrition happens after gaining experience.

Key insights: employees are staying long enough to build skills and then exiting, which may point to career stagnation, compensation limits, or external opportunities.

2. Attrition by Education field

The donut chart shows attrition distribution across backgrounds

- Life science - 41%
- Medical - 31%
- Marketing - 11%
- Technical - 9%
- Others - 6%

interpretation:

- Nearly 72% of attrition comes from life science and medical backgrounds, which likely to feed into R&D, Lab Technician, and Research scientist roles.
- These profiles are typically highly marketable, making them more prone to external job switches.

Business insights: High attrition in specialized education fields suggests:

- Strong external demand
- Possible pay competitiveness issues
- Limited internal mobility or research growth paths

3. Attrition by age group:

26 - 35 age group are in their prime career acceleration phase.

This group actively seeks:

- Faster promotions
- Higher pay
- Skills expansions
- Leadership opportunities

Key insights: the organization is losing its most productive and growth ready talent segment, which can directly impact the future leadership pipelines.

4. Attrition by salary slab

Salary based attrition clearly shows:

- Upto 5k = highest attrition
- 5k to 10 k = moderate
- 10k to 15k+ = very low attrition

Interpretation:

- Attrition is inversely proportional to salary.
- Lower paid employees are significantly more likely to leave

Business Insights: compensation is the primary driver of attrition. Retention strategies should prioritize salary structure, early pay correction, performance linked increments.

5. Attrition by job role

Job role bar chart highlights:

- Laboratory technician
- Sales executives
- Research scientist
- Sales representative

Interpretation:

- Lab technicians and research scientist are skills intensive roles with higher external demand
- Sales role are naturally higher churn due to pressure, targets, and incentive driven exits.

Key insights: attrition is concentrated in operational and revenue driving roles which can increase hiring cost, impact productivity, create customer facing instability

6. Attrition by years at company

The line chart shows:

- Peak attrition around 1- 3 years
- Sharp decline after 5 years
- Almost zero attrition after 10 years

Interpretation:

- Early tenure is the highest risk period
- Once employee crosses a stability threshold, they tend to stay long term.

Business insights: This organization needs strong onboarding programs, early engagement programs, and career planning within first 2 years.

7. Performance rating and attrition

The rating table shows attrition across all performance rating (1 - 4) where attrition is not limited to low performers and a significant number of high performer employees have left.

Interpretation:

- Attrition is not performance driven
- Even valuable talent is exiting

Critical insights: this is a redflag for losing high performers which indicate poor reward differentiation, lack of recognition, and limited growth visibility.

8. Gender distribution

The gender split indicate that male employees form large portion of attrition. However, attrition exists across both genders.

Insights: gender doesnot appear to be the primary attrition driver, other structural factors (salary, role, age) dominate
